

Why invest in APPLICATION MANAGER ?

- Saves you time by fully automating application deployment processes across enrolled devices.
- Provides a web-based management portal allowing you to select and manage applications needing to be installed or uninstalled.
- Application management is possible through Intune, MECM, and WSUS support.
- Eliminate end user disruptions by sending notifications of upcoming updates as well as schedule updates around their schedule.

Everyone deserves automated application updates.

CENTRALIZED APPLICATION MANAGEMENT

Application Manager frees up time for everyone. From the help desk who no longer needs to schedule time to install software updates to the end users who do not have their days disrupted. When applications are managed automatically and centrally, software related disruptions are no longer a common occurrence.

AUTOMATING SECURITY UPDATES

Third-party applications and systems waiting for an update cause a significant security risk to organizations of all shapes and sizes. Application Manager keeps applications up to date, helping to combat the vulnerabilities caused by out-of-date applications.

EFFORTLESS APPLICATION DEPLOYMENT

With Application Manager, it is easy to automate even the most complex application deployment processes. Automation speeds up the entire process, while decreasing the vulnerabilities and manual time spent pushing updates.

“ Application Manager functions quietly and seamlessly in the background. ”

- IT System Manager

What are the benefits of centralized patch management?

- Application updates are constantly coming online and are required due to security and functionality improvements. Centralized update management is the easiest and safest way to keep the application environment up to date with each passing release.
- Patch management helps analyze the applications within a system, detecting out-of-date versions that might call for an update.
- Software updates help fix issues that are detected after the software has already been released and help improve software security, usability, and functionality.

Application Manager is a tool for more than just patch management

Application Manager is a versatile tool for all your application life cycle management needs. It also meets the needs of managed service providers, as it can be used in endless environments. If you are an MPS and would like to learn more, please visit our MPS dedicated webpage [here](#).
